

Scan Station Setup and Workflow

1. The setup is 2 to 3 checkout volunteers with a contiguous table placed in the kitchen forming a "notch" which effectively increases the runway by about six feet leaving less log jam blockage.
2. The first cart is slid perpendicular into the notch to the right of the pantry floor volunteer who immediately unloads the entire cart onto the kitchen table where the scanner sits.
3. The pantry floor volunteer quickly moves the unloaded cart against the wall.
4. The scanner volunteer scans everything while moving items across the green stick to the bagger in the kitchen side. The pantry floor volunteer can assist when there is time permitting.
5. The bagger and/or client bags the scanned items and the client or pantry floor volunteer then places them in the waiting cart.
6. Meanwhile, the pantry floor volunteer immediately unloads the incoming cart, even if bagging is still taking place, to prep for scanning.
